

Azhl – Minutes of Meeting

Date: 13 August 2026

Project: Azhl

Topic: Admin Panel Updates & Referral Management

1. Referral Performance on Dashboard

The Admin Dashboard should include a section to highlight users whose **referral codes are generating the highest number of successful user registrations**.

The dashboard should allow the admin to easily identify:

- Top referring users
- Referral code/user
- Total users joined through each referral
- Referral performance/ranking

The purpose is to provide clear visibility into the **best-performing referrals** directly from the dashboard.

2. Order Receipt Download from Admin Panel

The **Order Receipt** should be downloadable directly from the Admin Panel.

Receipt download access should be available to:

- **Admin**
- **Super Admin**
- **Company Users** who have the required permission/access

Authorized company users should be able to download the same order receipt from the panel without requiring Super Admin access.

3. Remove Unnecessary User Information

Remove unnecessary user information from the Admin Panel that is **not collected from users in the application**.

For example:

- Email
- City

Any other fields that are currently displayed in the panel but are not actually collected during user registration/profile setup should also be removed.

The Admin Panel should only display information that is actually available and relevant in the Azhl application.

4. Notification Section – Specific User(s)

In the Admin Panel's **Notification** section, the current **Specific User(s)** functionality needs to be updated.

Currently, its behavior/interface is similar to **Group Broadcast**.

This should be changed to a proper **user-based notification system**.

Required Behavior

For **Specific User(s)**:

- Admin should be able to search for users.
- Admin should be able to select one or multiple specific users.
- Notifications should only be sent to the selected users.
- User selection should be clearly visible before sending the notification.
- It should remain functionally separate from **Group Broadcast**.

Group Broadcast

Group Broadcast will continue to be used for sending notifications to complete user groups/categories.

Specific User(s)

Specific User(s) will be used when the admin wants to target individually selected users rather than an entire group.

Final Action Items

1. Add **Top Referral Users** section to the dashboard.
2. Display referral performance based on the number of users joined through referral codes.
3. Enable **Order Receipt download** for Admin, Super Admin, and authorized Company Users.
4. Remove fields such as **Email and City** where those details are not collected from users.
5. Update **Specific User(s)** notification functionality to use individual user selection.
6. Keep **Specific User(s)** and **Group Broadcast** as separate notification flows.
